Influenced especially by work of Aldous, de Finetti, Kallenberg, Lovász, Schervish, and others.

Statistical Machine Learning
Given some data $X_{1}, X_{2}, \ldots$
identify hidden structure/patterns
in order to predict future or missing data.

1. (height, weight, age) of students

$$
X=\begin{array}{lll}
171 \mathrm{~cm} & 65 \mathrm{~kg} & 21 \\
182 \mathrm{~cm} & 70 \mathrm{~kg} & 19 \\
170 \mathrm{~cm} & ? & 20
\end{array}
$$

2. daily average (temperature, humidity, rainfall) in Guanajuato

$$
X=\begin{array}{lll}
21^{\circ} \mathrm{C} & 40 \% & 0 \mathrm{~cm} \\
27^{\circ} \mathrm{C} & 50 \% & 0 \mathrm{~cm} \\
30^{\circ} \mathrm{C} & 60 \% & ?
\end{array}
$$

3. $X=$ scores/ratings for movies by users

$$
X=\begin{array}{cccccc}
5 & 5 & 5 & 3 & 2 & \ldots \\
2 & 1 & 2 & 5 & 5 & \ldots \\
5 & ? & 5 & 2 & 3 & \cdots \\
: & : & : & : & : &
\end{array}
$$

Is there structure in the data?

## What structure is in the data?

1. 

$$
\{\square, \quad \square, \quad \square, \quad \square, \quad \square, \quad \cdots\}
$$

2. 

$$
\square \rightarrow \square \rightarrow \square \rightarrow \square \rightarrow \square \quad \ldots
$$

3. 

Is there even more structure in the data?

1. $\mathbb{P}\left(\begin{array}{lll}171 \mathrm{~cm} & 65 \mathrm{~kg} & 21 \\ 182 \mathrm{~cm} & 70 \mathrm{~kg} & 19 \\ 170 \mathrm{~cm} & ? & 20\end{array}\right) \stackrel{?}{=} \mathbb{P}\left(\begin{array}{lll}182 \mathrm{~cm} & 70 \mathrm{~kg} & 19 \\ 171 \mathrm{~cm} & 65 \mathrm{~kg} & 21 \\ 170 \mathrm{~cm} & ? & 20\end{array}\right)$
(Swapped top and middle row.)
2. $\mathbb{P}\left(\begin{array}{lll}21^{\circ} \mathrm{C} & 40 \% & 0 \mathrm{~cm} \\ 27^{\circ} \mathrm{C} & 50 \% & 0 \mathrm{~cm} \\ 30^{\circ} \mathrm{C} & 60 \% & ?\end{array}\right) \stackrel{?}{=} \mathbb{P}\left(\begin{array}{lll}27^{\circ} \mathrm{C} & 50 \% & 0 \mathrm{~cm} \\ 21^{\circ} \mathrm{C} & 40 \% & 0 \mathrm{~cm} \\ 30^{\circ} \mathrm{C} & 60 \% & ?\end{array}\right)$
(Swapped top and middle row.)
3. $\mathbb{P}\left(\begin{array}{lllll}5 & 5 & 5 & 3 & 2 \\ 2 & 1 & 2 & 5 & 5 \\ 5 & 4 & 5 & 2 & 3\end{array}\right) \stackrel{?}{=} \mathbb{P}\left(\begin{array}{lllll}2 & 1 & 2 & 5 & 5 \\ 5 & 5 & 5 & 3 & 2 \\ 5 & 4 & 5 & 2 & 3\end{array}\right)$
(Swapped top and middle row.)

$$
\stackrel{?}{=} \mathbb{P}\left(\begin{array}{lllll}
1 & 2 & 2 & 5 & 5 \\
5 & 5 & 5 & 3 & 2 \\
4 & 5 & 5 & 2 & 3
\end{array}\right)
$$

(Swapped first and second columns.)
$\stackrel{?}{=} \mathbb{P}\left(\begin{array}{lllll}5 & 5 & 2 & 2 & 1 \\ 5 & 5 & 5 & 3 & 2 \\ 5 & 5 & 4 & 3 & 2\end{array}\right)$
(Sorted each row.)

## Probabilistic symmetries

1. Exchangeable sequence
$\mathbb{P}\left[\left(X_{1}, X_{2}, \ldots, X_{n}\right)\right]=\mathbb{P}\left[\left(X_{4}, X_{n}, \ldots, X_{1}\right)\right]=\mathbb{P}\left[\left(X_{\pi(1)}, \ldots, X_{\pi(n)}\right)\right]$ Invariance to permutation.
2. Stationary sequence
$\mathbb{P}\left[\left(X_{1}, X_{2}, \ldots\right)\right]=\mathbb{P}\left[\left(X_{4}, X_{5}, \ldots\right)\right]=\mathbb{P}\left[\left(X_{k+1}, X_{k+2}, \ldots\right)\right]$
Invariance to shift.
3. Exchangeable array
$\mathbb{P}\left[\left(\begin{array}{ccc}X_{1,1} & X_{1,2} & \cdots \\ X_{2,1} & X_{2,2} & \cdots \\ X_{3,1} & X_{3,2} & \cdots \\ \vdots & \vdots & \ddots\end{array}\right)\right]=\mathbb{P}\left[\left(\begin{array}{ccc}X_{\pi(1), \tau(1)} & X_{\pi(1), \tau(2)} & \cdots \\ X_{\pi(2), \tau(1)} & X_{\pi(2), \tau(2)} & \cdots \\ X_{\pi(3), \tau(1)} & X_{\pi(3), \tau(2)} & \cdots \\ \vdots & \vdots & \ddots\end{array}\right)\right]$
Invariance to separate permutation of rows and columns.
What is the most general way to model data assuming these symmetries?

## Goals of this tutorial

1. Give a review of exchangeability in several forms.
2. Link each type of exchangeability to a representation theorem.
3. Explain how to interpret these representation theorems in their various forms.
4. Convey that probabilistic symmetries are an important consideration when constructing a statistical model.

## Tutorial Outline

1. Exchangeable sequences.
2. Exchangeable graphs and arrays.

## Caveats

A rigorous account requires measure theory.

1. All spaces are complete, separable metric spaces, equipped with their Borel $\sigma$-algebras.
2. All functions and sets are measurable.
3. Some necessary details will appear in a light gray color like this. Ignore these for now, and go back and study them later to understand the material at a greater depth.
4. I will define the "naturals" to be $\mathbb{N}:=\{1,2, \ldots\}$.

## Exchangeable sequences

## Definition (exchangeable sequences)

Let $X_{1}, X_{2}, \ldots$ be a sequence of random variables taking values in a space $S$. We say the sequence is exchangeable when, for every permutation $\pi$ of $\mathbb{N}$,

$$
\begin{equation*}
\left(X_{1}, X_{2}, \ldots\right) \stackrel{d}{=}\left(X_{\pi(1)}, X_{\pi(2)}, \ldots\right) \tag{1}
\end{equation*}
$$

What does Eq. (1) mean?
$\Longleftrightarrow$ for all $n \in \mathbb{N}$,

$$
\begin{equation*}
\left(X_{1}, \ldots, X_{n}\right) \stackrel{d}{=}\left(X_{\pi(1)}, \ldots, X_{\pi(n)}\right) \tag{2}
\end{equation*}
$$

$\Longleftrightarrow$ for all $n \in \mathbb{N}$, and distinct $k_{1}, \ldots, k_{n} \in \mathbb{N}$,

$$
\begin{equation*}
\left(X_{1}, \ldots, X_{n}\right) \stackrel{d}{=}\left(X_{k_{1}}, \ldots, X_{k_{n}}\right) \tag{3}
\end{equation*}
$$

$\Longleftrightarrow$ for all $n \in \mathbb{N}$, and permutations $\pi$ of $[n]:=\{1,2, \ldots, n\}$,

$$
\begin{equation*}
\left(X_{1}, \ldots, X_{n}\right) \stackrel{d}{=}\left(X_{\pi(1)}, \ldots, X_{\pi(n)}\right) \tag{4}
\end{equation*}
$$

## Exchangeable sequences

## Definition (exchangeable sequences)

Let $X_{1}, X_{2}, \ldots$ be a sequence of random variables taking values in a space $S$. We say the sequence is exchangeable when, for every $n \in \mathbb{N}$ and permutation $\pi$ of $[n]$,

$$
\begin{equation*}
\left(X_{1}, \ldots, X_{n}\right) \stackrel{d}{=}\left(X_{\pi(1)}, \ldots, X_{\pi(n)}\right) \tag{1}
\end{equation*}
$$

What does Eq. (1) mean?
$\Longleftrightarrow$ for all subsets $A_{1}, \ldots, A_{n} \subseteq S$,

$$
\begin{equation*}
\mathbb{P}\left\{X_{1} \in A_{1}, \ldots, X_{n} \in A_{n}\right\}=\mathbb{P}\left\{X_{\pi(1)} \in A_{1}, \ldots, X_{\pi(n)} \in A_{n}\right\} \tag{2}
\end{equation*}
$$

$\Longleftrightarrow$ for all subsets $A_{1}, \ldots, A_{n} \subseteq S$,

$$
\begin{equation*}
\mathbb{P}\left\{X_{1} \in A_{1}, \ldots, X_{n} \in \bar{A}_{n}\right\}=\mathbb{P}\left\{X_{1} \in A_{\pi(1)}, \ldots, X_{n} \in A_{\pi(n)}\right\} \tag{3}
\end{equation*}
$$

Invariance of the distribution.

## Examples of exchangeable sequences

i.i.d. sequences are exchangeable

Recall that a sequence $X_{1}, X_{2}, \ldots$ of random variables is independent when

$$
\begin{equation*}
\mathbb{P}\left\{X_{1} \in A_{1}, \ldots, X_{n} \in A_{n}\right\}=\prod_{i=1}^{n} \mathbb{P}\left\{X_{i} \in A_{i}\right\} \tag{4}
\end{equation*}
$$

for all $n \in \mathbb{N}$ and subsets $A_{1}, \ldots, A_{n} \subseteq S$, and is independent and identically distributed (i.i.d.) when

$$
\begin{equation*}
\mathbb{P}\left\{X_{1} \in A_{1}, \ldots, X_{n} \in A_{n}\right\}=\prod_{i=1}^{n} \mathbb{P}\left\{X_{1} \in A_{i}\right\}=\prod_{i=1}^{n} \mu\left(A_{i}\right) \tag{5}
\end{equation*}
$$

where $\mu=\mathbb{P}\left\{X_{1} \in \cdot\right\}$ is the marginal distribution of every element. We will say that $X_{1}, X_{2}, \ldots$ is i.i.d.- $\mu$.

For every permutation $\pi$ of $[n]=\{1,2, \ldots, n\}$.

$$
\begin{equation*}
\prod_{i=1}^{n} \mu\left(A_{\pi(i)}\right)=\prod_{i=1}^{n} \mu\left(A_{i}\right) \tag{6}
\end{equation*}
$$

## Examples of exchangeable sequences

conditionally i.i.d. sequences are exchangeable
Recall that a sequence $X_{1}, X_{2}, \ldots$ of random variables is conditionally independent when there is a random variable $\theta$ such that a.s.

$$
\begin{equation*}
\mathbb{P}\left[X_{1} \in A_{1}, \ldots, X_{n} \in A_{n} \mid \theta\right]=\prod_{i=1}^{n} \mathbb{P}\left[X_{i} \in A_{i} \mid \theta\right] \tag{7}
\end{equation*}
$$

for all $n \in \mathbb{N}$ and $A_{1}, \ldots, A_{n} \subseteq S$, and is conditionally i.i.d. given $\theta$ when a.s.

$$
\begin{equation*}
\mathbb{P}\left[X_{1} \in A_{1}, \ldots, X_{n} \in A_{n} \mid \theta\right]=\prod_{i=1}^{n} \mathbb{P}\left[X_{1} \in A_{i} \mid \theta\right]=\prod_{i=1}^{n} \nu\left(A_{i}\right) \tag{8}
\end{equation*}
$$

where $\nu:=\mathbb{P}\left[X_{1} \in \cdot \mid \theta\right]$ is the (random) marginal distribution, conditioned on $\theta$. Note that the sequence is also conditionally i.i.d. $-\nu$ given $\nu$.

Let $X_{1}, X_{2}, \ldots$ be conditionally i.i.d. $-\nu$ given $\nu$. Let $n \in \mathbb{N}, \pi$ a permutation of $[n]$.

$$
\begin{align*}
& \mathbb{P}\left\{X_{\pi(1)} \in A_{1}, \ldots, X_{\pi(1)} \in A_{n}\right\}  \tag{9}\\
& =\mathbb{E}\left(\mathbb{P}\left[X_{\pi(1)} \in A_{1}, \ldots, X_{\pi(1)} \in A_{n} \mid \nu\right]\right)=\mathbb{E}\left(\prod_{i=1}^{n} \nu\left(A_{i}\right)\right) \tag{10}
\end{align*}
$$

## Examples of exchangeable sequences

## Pólya's urn

Let $S=\{0,1\}$.
Let $\mathbb{P}\left\{X_{1}=1\right\}=\mathbb{P}\left\{X_{1}=0\right\}=1 / 2$. In other words,

$$
\begin{equation*}
X_{1} \sim \operatorname{Bernoulli}(1 / 2) \tag{11}
\end{equation*}
$$

Let $S_{n}=X_{1}+\cdots+X_{n}$.

$$
\begin{equation*}
\mathbb{P}\left[X_{n+1}=1 \mid X_{1}, \ldots, X_{n}\right]=\frac{S_{n}+1}{n+2} . \tag{12}
\end{equation*}
$$

In other words,

$$
\begin{equation*}
X_{n+1} \mid X_{1}, \ldots, X_{n} \sim \operatorname{Bernoulli}\left(\frac{S_{n}+1}{n+2}\right) \tag{13}
\end{equation*}
$$

$10110 ? \quad \mathbb{P}\{1$ next $\mid$ seen 10110$\}=\frac{3+1}{5+2}$.

## Examples of exchangeable sequences

## Pólya's urn

$$
\begin{align*}
X_{1} & \sim \operatorname{Bernoulli}(1 / 2)  \tag{14}\\
X_{n+1} \mid X_{1}, \ldots, X_{n} & \sim \operatorname{Bernoulli}\left(\frac{S_{n}+1}{n+2}\right), \quad \text { for } n \in \mathbb{N} . \tag{15}
\end{align*}
$$

Note that each element $X_{n+1}$ depends on all previous elements. No independence!

$$
\text { Let } x_{1}, \ldots, x_{n} \in\{0,1\} \text { and define } s_{j}=x_{1}+\cdots+x_{j} .
$$

$$
\begin{equation*}
\mathbb{P}\left\{X_{1}=x_{1}, X_{2}=x_{2}, \ldots, X_{n}=x_{n}\right\} \tag{16}
\end{equation*}
$$

$$
\begin{equation*}
=\mathbb{P}\left\{X_{1}=x_{1}\right\} \cdot \mathbb{P}\left\{X_{2}=x_{2} \mid X_{1}=x_{1}\right\} \cdots \mathbb{P}\left\{X_{n}=x_{n} \mid X_{1}=x_{1}, \ldots, X_{n-1}=x_{n-1}\right\} \tag{17}
\end{equation*}
$$

$=\underbrace{\left(\frac{1}{2}\right)}_{\mathbb{P}\left\{X_{1}=x_{1}\right\}} \cdot \underbrace{\left(\frac{s_{1}+1}{3}\right)^{x_{2}}\left(\frac{2-s_{1}}{3}\right)^{1-x_{2}} \cdots}_{\mathbb{P}\left\{X_{2}=x_{2} \mid X_{1}=x_{1}\right\}} \underbrace{\left(\frac{s_{n-1}+1}{n+1}\right)^{x_{n}}\left(\frac{n-1-s_{n-1}}{n+1}\right)^{1-x_{n}}}_{\mathbb{P}\left\{X_{n}=x_{n} \mid X_{1}=x_{1}, \ldots, X_{n-1}=x_{n-1}\right\}}$
$=\frac{\left(s_{n}\right)!\left(n-s_{n}\right)!}{(n+1)!} \quad$ this is invariant to permutation, hence exchangeable!

## Exchangeable sequences

## Theorem (de Finetti; Hewitt-Savage)

Let $X=\left(X_{1}, X_{2}, \ldots\right)$ be an infinite sequence of random variables in a space $S$.
The following are equivalent:

1. $X$ is exchangeable.
2. $X$ is conditionally i.i.d.

## Exchangeable:

$\left(X_{1}, X_{2}, \ldots\right) \stackrel{d}{=}\left(X_{\pi(1)}, X_{\pi(2)}, \ldots\right), \quad$ for $\pi \in S_{\infty}$
Conditionally i.i.d.: $\exists$ random variable $\theta$ s.t., for all $n$ and $A_{i}$, $\mathbb{P}\left[X_{1} \in A_{1}, \ldots, X_{n} \in A_{n} \mid \theta\right]=\prod_{i=1}^{n} \mathbb{P}\left[X_{1} \in A_{i} \mid \theta\right]$ a.s.

Equivalently, $\exists$ random probability measure $\nu$ s.t., for all $n$ and $A_{i}$, $\mathbb{P}\left[X_{1} \in A_{1}, \ldots, X_{n} \in A_{n} \mid \nu\right]=\prod_{i=1}^{n} \nu\left(A_{i}\right)$ a.s.

Taking expectations, $\mathbb{P}\left\{X_{1} \in A_{1}, \ldots, X_{n} \in A_{n}\right\}=\mathbb{E}\left(\prod_{i=1}^{n} \nu\left(A_{i}\right)\right)$.
Mixed i.i.d.: $\exists$ distribution $\mu$ (the de Finetti mixing measure) s.t., for all $n$ and $A_{i}$, $\mathbb{P}\left\{X_{1} \in A_{1}, \ldots, X_{n} \in A_{n}\right\}=\int \prod_{i=1}^{n} v\left(A_{i}\right) \mu(\mathrm{d} v)$

## PÓLYA'S URN

$$
\begin{align*}
X_{1} & \sim \operatorname{Bernoulli}(1 / 2)  \tag{25}\\
X_{n+1} \mid X_{1}, \ldots, X_{n} & \sim \operatorname{Bernoulli}\left(\frac{S_{n}+1}{n+2}\right), \quad \text { for } n \in \mathbb{N} \tag{26}
\end{align*}
$$

## Exchangeable:

$\mathbb{P}\left\{X_{1}=x_{1}, \ldots, X_{n}=x_{n}\right\}=\frac{\left(s_{n}\right)!\left(n-s_{n}\right)!}{(n+1)!}$
Conditionally i.i.d.: There is a random variable $\theta$ s.t. a.s.

$$
\begin{align*}
\mathbb{P}\left[X_{1}=x_{1}, \ldots, X_{n}=x_{n} \mid \theta\right] & =\prod_{i=1}^{n} \mathbb{P}\left[X_{1}=x_{i} \mid \theta\right]  \tag{28}\\
& =\mathbb{P}\left[X_{1}=1 \mid \theta\right]^{s_{n}} \mathbb{P}\left[X_{1}=0 \mid \theta\right]^{n-s_{n}}  \tag{29}\\
& =\nu_{1}^{s_{n}}\left(1-\nu_{1}\right)^{n-s_{n}} \tag{30}
\end{align*}
$$

where $\nu_{1}=\mathbb{P}\left[X_{1}=1 \mid \theta\right]$. Note that $\left(X_{n}\right)_{n \in \mathbb{N}}$ is conditionally i.i.d. given $\nu_{1}$. Are $\theta$ and $\nu_{1}$ different? How are they related?

Mixed i.i.d.: Let $\mu$ be the distribution of $\nu_{1}$. Taking expectations,
$\mathbb{P}\left\{X_{1}=x_{1}, \ldots, X_{n}=x_{n}\right\}=\int_{0}^{1} \vartheta^{s_{n}}(1-\vartheta)^{n-s_{n}} \mu(\mathrm{~d} \vartheta)$
Equating expressions for $\mathbb{P}\left\{X_{1}=x_{1}, \ldots, X_{n}=x_{n}\right\}$ implies $\mu=$ Uniform[0,1]!

## de Finetti's theorem in the case of Pólya's urn

Pólya's urn:

$$
\begin{align*}
X_{1} & \sim \operatorname{Bernoulli}(1 / 2)  \tag{32}\\
X_{n+1} \mid X_{1}, \ldots, X_{n} & \sim \operatorname{Bernoulli}\left(\frac{S_{n}+1}{n+2}\right), \quad \text { for } n \in \mathbb{N} \tag{33}
\end{align*}
$$

## Beta-Bernoulli process:

$$
\begin{align*}
\nu_{1} & \sim \mu  \tag{34}\\
X_{n} \mid \nu_{1} & \stackrel{i i d}{\sim} \operatorname{Bernoulli}\left(\nu_{1}\right), \quad \text { for } n \in \mathbb{N} \tag{35}
\end{align*}
$$

How are $X=\left(X_{n}\right)_{n \in \mathbb{N}}, \mathbb{P}[X]$ and $\nu_{1}, \mu=\mathbb{P}\left[\nu_{1}\right]$ related?
In what sense are $\nu_{1}$ and $\mu$ uniquely determined by $X$ and $\mathbb{P}[X]$ ?

- By the law of large numbers, and the disintegration theorem,

$$
\begin{equation*}
\frac{1}{n} \sum_{j=1}^{n} X_{j} \longrightarrow \nu_{1} \quad \text { as } \quad n \rightarrow \infty \tag{36}
\end{equation*}
$$

- If $\theta$ renders $X$ conditionally i.i.d., then $\nu_{1}=g(\theta)$ a.s. for some function $g$.
- If $\mu^{\prime}$ is a measure such that

$$
\begin{equation*}
\mathbb{P}\left\{X_{1}=x_{1}, \ldots, X_{n}=x_{n}\right\}=\int v^{s_{n}}(1-v)^{n-s_{n}} \mu^{\prime}(\mathrm{d} v) \tag{37}
\end{equation*}
$$

Daniel M. Roy $\quad$ then $\mu^{\prime}=\mathbb{P}\left[\nu_{1}\right]$.

## de Finetti's theorem in general

Let $X=\left(X_{n}\right)_{n \in \mathbb{N}}$ be an exchangeable sequence in a space $S$.
Let $\widehat{P}_{n}=\frac{1}{n}\left(\delta_{X_{1}}+\cdots+\delta_{X_{n}}\right)$ be the empirical measure.
Define a random measure $\nu$ on $S$ by

$$
\begin{equation*}
\nu(A)=\lim _{n \rightarrow \infty} \widehat{P}_{n}(A) \quad \text { a.s. } \quad A \subseteq S \tag{38}
\end{equation*}
$$

Informally, $\nu=\lim _{n \rightarrow \infty} \widehat{P}_{n}$. Let $\mu=\mathbb{P}[\nu]$.
Then $X$ is conditionally i.i.d. $-\nu$ given $\nu$. That is

$$
\begin{equation*}
X_{n} \mid \nu \stackrel{i i d}{\sim} \nu \tag{39}
\end{equation*}
$$

Uniqueness?

- If $\theta$ renders $X$ conditionally i.i.d., then $\nu=g(\theta)$ a.s. for some function $g$.
- If $\mu^{\prime}$ is a measure such that

$$
\begin{equation*}
\mathbb{P}\left\{X_{1} \in A_{1}, \ldots, X_{n} \in A_{n}\right\}=\int \prod_{i=1}^{n} v\left(A_{i}\right) \mu^{\prime}(\mathrm{d} v) \tag{40}
\end{equation*}
$$

$$
\text { then } \mu^{\prime}=\mathbb{P}[\nu] \text {. }
$$

## EXCHANGEABILITY AND STATISTICS

## Definition (Statistical inference base/model)

1. Sample space $\mathcal{X}$.
2. Parametric family $\mathcal{P}_{0}:=\left\{P_{\theta}\right\}_{\theta \in T}$ of probability distributions on $\mathcal{X}$ indexed by elements of $T$ called parameters. $T$ is called the parameter space.
3. Observed data $x^{*} \in \mathcal{X}$.
4. Loss function $L: T \times T \rightarrow \mathbb{R}$.

The risk of an estimator $\delta: S \rightarrow T$ for $t \in T$, is

$$
\begin{equation*}
R(\delta, \theta)=\mathbb{E}_{X \sim P_{\theta}}\{L(\theta, \delta(X))\}:=\int_{\mathcal{X}} L(\theta, \delta(x)) P_{\theta}(\mathrm{d} x) \tag{41}
\end{equation*}
$$

## Definition (Bayesian estimator)

Let $\theta$ be a random variable in $T$, with prior distribution $\pi$, and let $X \mid \theta \sim P_{\theta}$.
The Bayesian estimator minimizes the posterior expected loss:

$$
\begin{equation*}
\delta_{\pi}(x):=\arg \min _{\theta^{*} \in T} \mathbb{E}_{\theta \sim \mathbb{P}[\theta \mid X=x]}\left\{L\left(\theta, \theta^{*}\right)\right\} \tag{42}
\end{equation*}
$$

## Exchangeability and statistics: Not just Bayesian!

Classic i.i.d. framework
Let $X_{1}, \ldots, X_{n} \stackrel{i i d}{\sim} Q$, for an unknown distribution $Q \in \mathcal{Q}_{0}:=\left\{Q_{\theta}\right\}_{\theta \in T}$.
Say observations are $\mathbb{R}$-valued. We can formalize this as follows:

1. Sample space $\mathcal{X}=\mathbb{R}^{n}$
2. Parametric family $\mathcal{P}:=\left\{Q_{\theta}^{n}: \theta \in T\right\}$, where $Q^{n}$ is the $n$-fold product.

Let $\left(X_{1}, \ldots, X_{n}\right) \sim Q_{\theta}^{n}$, for an unknown $Q_{\theta}^{n} \in \mathcal{P}$.

## Exchangeable observation

Let $\left(X_{1}, \ldots, X_{n}\right) \sim P$ be conditionally i.i.d., for an unknown distribution $P$.

## Conditionally i.i.d. observation

Let $\left(X_{1}, \ldots, X_{n}\right) \mid \nu \sim \nu^{n}$ and $\nu \sim \mu$, for an unknown distribution $\mu$. Even as $n \rightarrow \infty$, data reflects only one realization $\nu$ from $\mu$. The problem of estimating $\mu$ is "ill-posed" to the frequentist. The Bayesian gets 1 data point.
Bayesian approach in the i.i.d. framework
Let $\theta$ be a random variable with some prior. Then $Q_{\theta}$ is a random measure, and $X_{1}, X_{2}, \ldots$ is an exchangeable sequence.

## "DE FINETTI'S THEOREM JUSTIFIES ..." NOT THE POINT.

## de Finetti's philosophy

1. de Finetti rejected the idea of a parameter and argued there was no need to assume their existence.
2. He thought that probabilities should be specified only on observable quantities.
3. de Finetti's theorem shows that conserved quantities (like the limiting frequency of 1's) arise from symmetries and are random variables.
4. One can then interpret this in the classic sense (specifying a parameter and placing a prior on it), but there's no need to do that. The underlying random measure $\nu$ is there whether you like it or not.

## Subjectivism

1. Distribution represents subjective (personal) uncertainty.
2. Exchangeability $\Longleftrightarrow$ certainty that order of the data is irrelevant.
3. subjective distribution on data alone + exchangeability $\Longrightarrow$ conditionally i.i.d. distribution on $\nu$ is subjective as well.
4. Note: de Finetti's holds only for infinite sequences, but subjectivist need only be unwilling to posit an upper bound on the data size and projectivity.

## CONNECTION WITH NONPARAMETRIC INFERENCE

What does exchangeability have to do with nonparametric Bayesian statistics?

## Bayesian

1. Model: $X_{1}, X_{2}, \ldots \stackrel{i i d}{\sim} Q$ for unknown $Q \in \mathcal{Q}_{0}$. Need prior on $\mathcal{Q}_{0}$.
2. If $\mathcal{Q}_{0}=\{$ Gaussian distributions on $\mathbb{R}\}$ then $\mathcal{Q}_{0} \cong \mathbb{R}^{2}$.

Finite-dimensional space, hence parametric.
3. If $\mathcal{Q}_{0}=\{$ All Borel probability measures on $\mathbb{R}\}$ then $\mathcal{Q}_{0} \cong \mathbb{R}^{\mathbb{N}}$.

Infinite-dimensional space, hence nonparametric.
4. Hard. But if you have a specific question to ask (e.g., what is $Q(A)$ for some set $A$ ?) then it's possible.
5. Dirichlet process, Polya trees, Normalized Completely Random Measures, etc.

## Subjectivist

1. Need a model for our data $X_{1}, X_{2}, \ldots$
2. If we believe order is irrelevant, by exchangeability, it suffices to specify a prior measure $\mu$ on space of probability measures.
3. No further assumptions: support of $\mu$ must be all distributions.

## So far we have...

1. Reviewed exchangeability for sequences.
2. Presented de Finetti's representation theorem.

Exchangeable if and only if conditionally i.i.d.
3. Discussed how to interpret de Finetti's theorems in its various forms.
4. Shown that probabilistic symmetries lead to statistical models. Exchangeability leads to a Bayesian approach to the classic i.i.d. framework.

Tutorial Outline

1. Exchangeable sequences.
2. Exchangeable graphs and arrays.

## Exchangeable graphs

Let $X=\left(X_{i, j}\right)_{i, j \in \mathbb{N}}$ be the adjacency matrix of an undirected graph on $\mathbb{N}$.

Definition (jointly exchangeable array)
Call $X$ (jointly) exchangeable when, for every permutation $\pi$ of $\mathbb{N}$,

$$
\begin{equation*}
\left(X_{i, j}\right)_{i, j \in \mathbb{N}} \stackrel{d}{=}\left(X_{\pi(i), \pi(j)}\right)_{i, j \in \mathbb{N}} . \tag{43}
\end{equation*}
$$

Most figures by James Lloyd (Cambridge) and Peter Orbanz (Columbia)

## Definition (jointly exchangeable array)

Call $X$ (jointly) exchangeable when, for every permutation $\pi$ of $\mathbb{N}$,

$$
\begin{equation*}
\left(X_{i, j}\right)_{i, j \in \mathbb{N}} \stackrel{\text { d }}{=}\left(X_{\pi(i), \pi(j)}\right)_{i, j \in \mathbb{N}} . \tag{44}
\end{equation*}
$$

equivalently

$$
\left(\begin{array}{ccc}
X_{1,1} & X_{1,2} & \cdots  \tag{45}\\
X_{2,1} & X_{2,2} & \cdots \\
X_{3,1} & X_{3,2} & \cdots \\
\vdots & \vdots & \ddots
\end{array}\right) \stackrel{\text { d }}{=}\left(\begin{array}{ccc}
X_{\pi(1), \pi(1)} & X_{\pi(1), \pi(2)} & \cdots \\
X_{\pi(2), \pi(1)} & X_{\pi(2), \pi(2)} & \cdots \\
X_{\pi(3), \pi(1)} & X_{\pi(3), \pi(2)} & \cdots \\
\vdots & \vdots & \ddots
\end{array}\right)
$$

In the case $X_{i, j} \in\{0,1\}$, let $X^{n}=\left(X_{i, j}\right)_{i, j \leq n}$. Then $X$ is an exchangeable graph if for all $n \in \mathbb{N}$ and isomorphic graphs $G, G^{\prime}$ on $[n], \mathbb{P}\left\{X^{n}=G\right\}=\mathbb{P}\left\{X^{n}=G^{\prime}\right\}$.

## EXAMPLES OF EXCHANGEABLE GRAPHS

Are the following graphs exchangeable?

## Example

$$
\begin{equation*}
X_{i, j}:=0 \quad \text { for } i<j \in \mathbb{N} \tag{46}
\end{equation*}
$$

Yes.
Example

$$
\begin{equation*}
X_{i, j}:=1 \quad \text { for } i<j \in \mathbb{N} \tag{47}
\end{equation*}
$$

Yes.

## EXAMPLES OF EXCHANGEABLE GRAPHS

Is the following graph exchangeable?

## Example

$$
\left.\begin{array}{c}
X_{i, j}:=(j-i) \bmod 2, \quad \text { for } i<j \in \mathbb{N}  \tag{48}\\
\mathbb{P}\left\{X^{3}=(1) 3\right.
\end{array}\right)
$$

No.

## EXAMPLES OF EXCHANGEABLE GRAPHS

Is the following graph exchangeable?

## Example

Consider the graph with vertex set $\mathbb{N}$ such that for every pair of vertices $i, j \in \mathbb{N}$, we include the edge $\{i, j\}$ independently with probability $p \in[0,1]$.

The adjacency matrix $X$ is such that

$$
\begin{equation*}
X_{i, j} \stackrel{i i d}{\sim} \operatorname{Bernoulli}(p) \quad \text { for } i<j \in \mathbb{N} . \tag{49}
\end{equation*}
$$

Let $G$ be a graph on $[n]$. Then $\mathbb{P}\left\{X^{n}=G\right\}=2^{-\binom{n}{2}^{2}}$.
Yes.
The resulting graph is a so-called "Erdös-Rényi graph".

## EXAMPLES OF EXCHANGEABLE GRAPHS

Is the following graph exchangeable?

Example
Let $X_{1,2} \sim \operatorname{Bernoulli}(1 / 2)$.
Otherwise, let

$$
\begin{equation*}
X_{i, j}:=X_{1,2} \quad \text { for } i<j \in \mathbb{N} \tag{50}
\end{equation*}
$$

Yes.

## EXAMPLES OF EXCHANGEABLE GRAPHS

Is the following graph exchangeable?

## Example

Let $Y_{1}, Y_{2}, \ldots$ be a Pólya urn. Let $\phi: \mathbb{N}^{2} \rightarrow \mathbb{N}$ be a bijection. Let

$$
\begin{equation*}
X_{i, j}:=Y_{\phi(i, j)} \quad \text { for } i<j \in \mathbb{N} . \tag{51}
\end{equation*}
$$

Yes.

## EXAMPLES OF EXCHANGEABLE GRAPHS

Is the following graph exchangeable?

## Example

Consider the graph built one vertex at a time, adding a vertex to a clique with probability proportional to the size of the clique, and creating a new (singleton) clique with probability proportional to a constant $\alpha>0$.

3

6

2

3
$\alpha$

Yes.

The process is just an graph version of the Chinese restaurant process and is very closely related to the Infinite Relational Model of Kemp et al. (2008).

## EXAMPLES OF EXCHANGEABLE GRAPHS

Is the following graph exchangeable?

## Example

Let $N=\left(N_{1}, N_{2}, \ldots\right)$ be an i.i.d. sequence Gaussian vectors in $\mathbb{R}^{D}$.
Let $\langle\cdot, \cdot\rangle$ be the dot product.
Let sigmoid : $\mathbb{R} \rightarrow[0,1]$ be a squashing function.

$$
\begin{equation*}
X_{i, j} \mid N \stackrel{i n d}{\sim} \operatorname{Bernoulli}\left(\operatorname{sigmoid}\left(\left\langle N_{i}, N_{j}\right\rangle\right)\right) \quad \text { for } i<j \in \mathbb{N} \tag{52}
\end{equation*}
$$

Yes.

This model is related to matrix factorization techniques, as well as the eigenmodel (Hoff 2008).

Let $U_{1}, U_{2}, \ldots$ be i.i.d. uniform random variables in $[0,1]$.

## Definition ( $\Theta$-random graph)

Let $\Theta:[0,1]^{2} \rightarrow[0,1]$ be a symmetric measurable function, and let

$$
\begin{equation*}
X_{i, j}:=1 \text { with probability } \Theta\left(U_{i}, U_{j}\right) \tag{53}
\end{equation*}
$$

independently for every $i<j \in \mathbb{N}$. By a $\Theta$-random graph we mean an array with the same distribution as $X$.

Let $\mathcal{W}$ be the space of symmetric measurable functions from $[0,1]^{2}$ to $[0,1]$. Such functions $\Theta$ are called "graphons".

Let $G$ be a graph on $[n]:=\{1, \ldots, n\}$.

$$
\begin{equation*}
\mathbb{P}\left\{X^{n}=G \mid U_{1}, \ldots, U_{n}\right]=\prod_{i, j} \Theta\left(U_{i}, U_{j}\right)^{G_{i, j}}\left(1-\Theta\left(U_{i}, U_{j}\right)\right)^{1-G_{i, j}} \text { a.s. } \tag{54}
\end{equation*}
$$

Taking expectations,
$\mathbb{P}\left\{X^{n}=G\right\}=\int_{[0,1]^{n}} \prod_{i, j} \Theta\left(u_{i}, u_{j}\right)^{G_{i, j}}\left(1-\Theta\left(u_{i}, u_{j}\right)\right)^{1-G_{i, j}} \mathrm{~d} u_{1} \cdots \mathrm{~d} u_{n}$

Theorem (Aldous, Hoover)
Let $X=\left(X_{i, j}\right)_{i, j \in \mathbb{N}}$ be the adjacency matrix of an undirected graph on $\mathbb{N}$. The following are equivalent:

1. $X$ is jointly exchangeable.
2. $X$ is conditionally $\Theta$-random, given a random graphon $\Theta$.

## GRAPHONS UNDERLYING EXCHANGEABLE GRAPHS

Example 1 - empty graph
Let $\Theta(u, v)=0$.
Example 2 - complete graph
Let $\Theta(u, v)=1$.
Example 3 - Erdos-Renyi graph
For $p \in[0,1]$, let $\Theta(u, v)=p$.

## Graphons underlying exchangeable graphs

$$
\begin{align*}
& \text { Example } \\
& \text { Let } Y_{1}, Y_{2}, \ldots \text { be a Pólya urn. Let } \phi: \mathbb{N}^{2} \rightarrow \mathbb{N} \text { be a bijection. } \\
& \text { Let } \\
& \qquad X_{i, j}:=Y_{\phi(i, j)} \quad \text { for } i<j \in \mathbb{N} . \tag{56}
\end{align*}
$$

What's $\Theta$ ?

Let $p \sim$ Uniform. Let $\Theta(u, v)=p$.

## Graphons underlying exchangeable graphs

## Example

Let $X_{1,2} \sim \operatorname{Bernoulli}(1 / 2)$.
Otherwise, let

$$
\begin{equation*}
X_{i, j}:=X_{1,2} \quad \text { for } i<j \in \mathbb{N} \tag{57}
\end{equation*}
$$

What's $\Theta$ ?

Let $p \sim \operatorname{Bernoulli}(1 / 2)$. Let $\Theta(u, v)=p$.

## GRAPHONS UNDERLYING EXCHANGEABLE GRAPHS

## Example

Let $N=\left(N_{1}, N_{2}, \ldots\right)$ be an i.i.d. sequence Gaussian vectors in $\mathbb{R}^{D}$.
Let $\langle\cdot, \cdot\rangle$ be the dot product.
Let sigmoid : $\mathbb{R} \rightarrow[0,1]$ be a squashing function.

$$
\begin{equation*}
X_{i, j} \mid N \stackrel{\text { ind }}{\sim} \operatorname{Bernoulli}\left(\operatorname{sigmoid}\left(\left\langle N_{i}, N_{j}\right\rangle\right)\right) \quad \text { for } i<j \in \mathbb{N} . \tag{58}
\end{equation*}
$$

## What's $\Theta$ ?

Let $g:[0,1] \rightarrow \mathbb{R}^{d}$ be such that $g(U) \sim \mathcal{N}_{D}\left(0, I_{D}\right)$ when $U \sim$ Uniform.
Let $\Theta(u, v)=\operatorname{sigmoid}(\langle g(u), g(v)\rangle)$.
Implicitly, we've been dealing with graphons "defined" on the probability space $\left([0,1], \mathcal{B}_{[0,1]}\right.$, Uniform).

Consider instead a graphon $\Theta^{\prime}$ defined on $\left(\mathbb{R}^{D}, \mathcal{B}_{\mathbb{R}^{D}}, \mathcal{N}_{D}\left(0, I_{D}\right)\right)$ given by $\Theta^{\prime}(n, m)=\operatorname{sigmoid}(\langle n, m\rangle)$.

## GRAPHONS UNDERLYING EXCHANGEABLE GRAPHS

## Example

Consider the graph built one vertex at a time, adding a vertex to a clique with probability proportional to the size of the clique, and creating a new (singleton) clique with probability proportional to a constant $\alpha>0$.

3

6

2

3
$\alpha$

## What's $\Theta$ ?

Let $p_{1} \geq p_{2} \geq \cdots$ be a draw from Poisson-Dirichlet distribution (limiting table size proportions in CRP), considered as a random distribution on $\mathbb{N}$.
Let $\left(\mathbb{N}, \mathcal{B}_{\mathbb{N}}, p\right)$ be the random probability space.
Consider a graphon $\Theta^{\prime}$ on this random probability space, given by

$$
\Theta^{\prime}(n, m)=1 \text { if } n=m,=0 \text { otherwise. }
$$

On $\left([0,1], \mathcal{B}_{[0,1]}\right.$, Uniform)?

$$
\Theta(u, v)=\Theta^{\prime}(g(u), g(v)) \text { where } g(u)=\sup \left\{n \in \mathbb{N}: u \leq p_{n}\right\}
$$

## Graphons underlying exchangeable graphs

Example

$$
\begin{equation*}
X_{i, j}:=(j-i) \bmod 2, \quad \text { for } i<j \in \mathbb{N} . \tag{59}
\end{equation*}
$$

What's $\Theta$ ?
$X$ is not exchangeable, so there is no such $\Theta$ !

## EXCHANGEABLE SEQUENCES

## Theorem (Aldous, Hoover)

Let $X=\left(X_{i, j}\right)_{i, j \in \mathbb{N}}$ be the adjacency matrix of an undirected graph on $\mathbb{N}$. The following are equivalent:

1. $X$ is jointly exchangeable.
2. $X$ is conditionally $\Theta$-random, given a random graphon $\Theta$.

## Exchangeable:

$\left(X_{i, j}\right)_{i, j \in \mathbb{N}} \stackrel{\text { d }}{=}\left(X_{\pi(i), \pi(j)}\right)_{i, j \in \mathbb{N}}, \quad$ for $\pi \in S_{\infty}$
Conditionally $\Theta$-random: $\exists$ random graphon $\Theta$ s.t., for all finite graphs $G$ on $[n]$, $\mathbb{P}\left[X^{n}=G \mid \Theta\right]=\int_{[0,1]^{n}} \prod_{i, j} \Theta\left(u_{i}, u_{j}\right)^{G_{i, j}}\left(1-\Theta\left(u_{i}, u_{j}\right)\right)^{1-G_{i, j}} \mathrm{~d} u_{1} \cdots \mathrm{~d} u_{n}$

Taking expectations, $\exists$ distribution $\mu$ on graphons s.t. for all finite graphs $G$ on $[n]$,
$\mathbb{P}\left\{X^{n}=G\right\}=\iint_{[0,1]^{n}} \prod_{(i, j) \in G} \theta\left(u_{i}, u_{j}\right) \prod_{(i, j) \notin G}\left(1-\theta\left(u_{i}, u_{j}\right)\right) \mathrm{d} u_{1} \cdots \mathrm{~d} u_{n} \mu(\mathrm{~d} \theta)$

## $\Theta$ AS THE LIMITING EMPIRICAL GRAPHON

## Exchangeable sequences

Recall that if $Y=\left(Y_{1}, Y_{2}, \ldots\right)$ is an exchangeable sequence then $\widehat{P}_{n} \rightarrow \nu$ a.s.

Exchangeable graphs
Let $X=\left(X_{i, j}\right)_{i, j \in \mathbb{N}}$ is an exchangeable graph.

You can recover the graphon $\Theta$ underlying a graph by sampling larger and larger graphs. Suitably permuted, they converge in $L^{1}$ with probability one.

## $\Theta$ IS NOT UNIQUE (AS A FUNCTION)

Exchangeable sequences and the uniqueness of $\mu=\mathbb{P}[\nu]$
If $X_{1}, X_{2}, \ldots$ is an exchangeable sequence, there is a UNIQUE $\mu$ s.t.

$$
\begin{equation*}
\mathbb{P}\left\{X_{1} \in A_{1}, \ldots, X_{n} \in A_{n}\right\}=\int \prod_{i=1}^{n} v\left(A_{i}\right) \mu(\mathrm{d} v) \tag{62}
\end{equation*}
$$

Exchangeable graphs and the uniqueness of $\mu=\mathbb{P}[\Theta]$
Let $X$ be a $\Theta$-random graph.
Let $T:[0,1] \rightarrow[0,1]$ be a measure preserving transformation, and define

$$
\begin{equation*}
\Theta^{T}(x, y):=\Theta(T(x), T(y)) \tag{63}
\end{equation*}
$$

$X$ is $\Theta^{T}$-random too! $\Theta^{T}$ and $\Theta$ induce the same distribution on graphs.

## Theorem (Hoover)

The graphon $\Theta$ underlying a $\Theta$-random graph is unique up to a measure preserving transformation.

## We have now...

1. Reviewed exchangeability for graphs
(i.e., symmetric $\{0,1\}$-valued arrays representing adjacency).
2. Presented Aldous-Hoover representation theorem in this special case.

Graph is exchangeable if and only if conditionally $\Theta$-random
3. Discussed how to interpret Aldous-Hoover theorem.

Meaning of $\Theta$-random. $\Theta$ as the limiting empirical graphon. $\Theta$-nonuniqueness.
4. Shown that probabilistic symmetries lead to statistical models.

## Tutorial Outline

1. Exchangeable-sequences.
2. Exchangeable graphs and arrays.

## Exchangeable arrays

Let $X=\left(X_{i, j}\right)_{i, j \in \mathbb{N}}$ be an infinite array of random variables.
No longer assuming $\{0,1\}$-values or symmetry of $X$.
E.g., adjacency matrix for a directed graph, or matrix of user-movie ratings.

Definition (jointly exchangeable array)
We say that $X$ is jointly exchangeable when

$$
\begin{equation*}
X \stackrel{\mathrm{~d}}{=}\left(X_{\pi(i), \pi(j)}\right)_{i, j \in \mathbb{N}} \tag{64}
\end{equation*}
$$

for every permutation $\pi: \mathbb{N} \rightarrow \mathbb{N}$.
E.g., undirected graph, directed graph. Rows and columns are indexing "same set".

Definition (separately exchangeable array)
We say that $X$ is separately exchangeable (aka row-column exchangeable) when

$$
\begin{equation*}
X \stackrel{\mathrm{~d}}{=}\left(X_{\pi(i), \pi^{\prime}(j)}\right)_{i, j \in \mathbb{N}} \tag{65}
\end{equation*}
$$

for every pair of permutations $\pi, \pi^{\prime}: \mathbb{N} \rightarrow \mathbb{N}$.
E.g., user-movie ratings. Rows and columns indexing different sets.

## Exchangeable arrays

## Example

Elements $X_{i, j}$ i.i.d.
Separately exchangeable? Jointly exchangeable?

## Example

$X_{i, j}=1$ if $i=j$ and $X_{i, j}=0$ otherwise.
Separately exchangeable? Jointly exchangeable?

## Example

Let $U_{i, j}$ be i.i.d. Uniform random variables.
Let $X_{i, j}=f\left(U_{00}, U_{i, 0}, U_{0, j}, U_{i, j}\right)$ for a suitable function $f$. Separately exchangeable? Jointly exchangeable?

## Example

Let $U_{i}$ be i.i.d. Uniform random variables.
Let $X_{i, j}=g\left(U_{i}, U_{j}\right)$ for a suitable function $g$.
Separately exchangeable? Jointly exchangeable?

## Exchangeable arrays

Definition (Aldous-Hoover, separately exchangeable)
Let $U_{i, j}$ be i.i.d. Uniform random variables.
An infinite array $X$ is separately exchangeable if and only if

$$
\begin{equation*}
X \stackrel{\text { d }}{=}\left(f\left(U_{00}, U_{i, 0}, U_{0, j}, U_{i, j}\right)\right)_{i, j \in \mathbb{N}} \tag{66}
\end{equation*}
$$

for some measurable function $f$.
Definition (Aldous-Hoover, jointly exchangeable)
Let $U_{\{i, j\}}$ be i.i.d. Uniform random variables. That is $U_{\{i, j\}}=U_{\{j, i\}}$.
An infinite array $X$ is separately exchangeable if and only if

$$
\begin{equation*}
X \stackrel{d}{=}\left(f\left(U_{\{0,0\}}, U_{\{i, 0\}}, U_{\{0, j\}}, U_{\{i, j\}}\right)\right)_{i, j \in \mathbb{N}} \tag{67}
\end{equation*}
$$

for some measurable function $f$.

## Exchangeable arrays

## Example

Elements $X_{i, j}$ i.i.d.
Separately exchangeable: $f(a, b, c, d)=g(d)$.

## Example

$X_{i, j}=1$ if $i=j$ and $X_{i, j}=0$ otherwise.
Jointly exchangeable: $f(a, b, c, d)=1(b==c)$.

## Example

Let $X$ be $\Theta$-random.
Jointly exchangeable: $f(a, b, c, d)=1(d<\Theta(b, c))$.

## Exchangeable arrays

Let $Y_{1}, Y_{2}, \ldots$ be an exchangeable sequence. Define $X_{i, j}=Y_{j}$.
What does Aldous-Hoover tell us about $Y$ ?
Definition (de Finetti in Aldous-Hoover form)
Let $U_{i}$ be i.i.d. Uniform random variables.
An infinite sequence $Y_{1}, Y_{2}, \ldots$ is exchangeable if and only if

$$
\begin{equation*}
\left(Y_{i}\right)_{i \in \mathbb{N}} \stackrel{d}{=}\left(f\left(U_{0}, U_{i}\right)\right)_{i \in \mathbb{N}} \tag{68}
\end{equation*}
$$

for some measurable function $f$.

## Exchangeability and statistics: Not just Bayesian!

## Exchangeable observation, version 1

Let $\left(f\left(U_{0,0}, U_{i, 0}, U_{0, j}, U_{i, j}\right)\right)_{i, j \in \mathbb{N}}$ be a (partially-observed) exchangeable array, where $f$ is unknown and $\left(U_{i, j}\right)_{i, j \in \mathbb{N}}$ i.i.d. Uniform.
Define $F(b, c, d)=f\left(U_{0,0}, b, c, d\right) . F$ is a random measurable function.
Exchangeable observation, version 2
Let $\left(F\left(U_{i, 0}, U_{0, j}, U_{i, j}\right)\right)_{i, j \in \mathbb{N}}$ and $F \sim \mu$, where $\mu$ is unknown and $\left(U_{i, j}\right)_{i, j \in \mathbb{N}}$ i.i.d. Uniform.
Problem 1: Even observing entire array $X$ reflects only one realization $F$ from $\mu$.
Solution: Dissociated arrays (F non-random). These are the ergodic measures.
Problem 2: Random functions of the form $F(b, c, d)=G(b, c)$ are "dense".
Solution: Move to simple arrays, i.e., last parameter is not used.

## Simple dissociated array observation

Let $U_{i}, V_{j}$ be i.i.d. Uniform random variables.
Let $\left(F\left(U_{i}, V_{j}\right)\right)_{i, j \in \mathbb{N}}$ be a simple dissociated array, unknown $F$.

## Bayesian approach

Let $F$ be a random measurable function with some prior.
Then $X_{1}, X_{2}, \ldots$ is an exchangeable array.

In joint work with Orbanz [OR13], we show that many nonparametric models of graphs/networks can be recast as prior distributions on random functions $F$.

1. Infinite Relational Model (IRM) of Kemp et al. (2008) based on Chinese restaurant process (Dirichlet process).
2. IRM where the interaction probabilities are also an exchangeable array. [OR]
3. Infinite Feature Relational Model (IFRM) of Miller et al. (2010) based on Indian buffet process (Beta process).
4. Mondrian process-based relational model of R. and Teh (2009).
5. Gaussian-process-based relational model. Lloyd et al. NIPS 2012 show how many factorization models fit into this framework.

## We have...

1. Reviewed exchangeability for sequences, graphs, and arrays
2. Presented de Finetti and Aldous-Hoover representation theorems.
$X$ exchangeable if and only if $X \stackrel{\text { d }}{=}(F(\ldots))$ for a random $F$.
3. Discussed how to interpret de Finetti and Aldous-Hoover.
$\nu / \Theta / F$ is the limiting empirical distribution/graphon/array. $\nu$ unique. $\Theta$ and $F$ only unique up to a m.p.t.
4. Shown how probabilistic symmetries lead to statistical models.
